

## TYPES OF CAMOUFLAGE

**An animal's behaviors affect what type of camouflage is best for them. Select a pair of animals below and explain what type of camouflage is used by the predator/prey based on their behaviors.**

**Zebra and lion; seagull and spider crab; shark and seal;**

Zebra travel in herds so they use disruptive coloration so a lion cannot tell the difference between them. Lions use concealing coloration to blend in and make it easier to hide from their prey

Spider crabs do not move very fast so they use both concealing and disguise to look like a rock so the seagull cannot locate them.

Sharks use concealing, which is a type of concealing coloration. This breaks up their shape for when they are hunting seals.

**In the video, we discussed 3 types of camouflage. If you could have any of these types of camouflage, which would it be? Make sure to explain how your type of camouflage would affect your choice and habitat and what food you eat.**
